

CLAIMS

What I, Mark R. Haley, claim as my invention is :

- (1) Claim one is a unique combination of recording techniques and software that lets a computer talk and sound like a human and not a computer. This text-to-speech works on any device which carries speech or multimedia and it runs on both client PCs and servers. But it is unique in that it only requires the power of an off-the-shelf PC or computer device or other device which can carry speak such as a phone. Moreover it also has the option to translate the text from any language into any language and the computer speaks realistically in any language. Also, it has the option to simultaneously show related photos or videos that correspond to the original text which is converted to speech.
